SUMMARY

Senior full-stack engineer with 5+ years of commercial experience, specializing in Go (Golang) backends with TypeScript and React on top. Builds the parts of a product that cannot afford to lose data: payment flows, event-driven communication between services, and integrations with external providers that fail in unpredictable ways.

Strongest area is backend reliability. Idempotent APIs, transactional outboxes and reconciliation that operations can trust keep a retry, a duplicate message or a provider outage from turning into an incident. Took a product from zero to production, moved monoliths to Go services, and worked on systems with 3M users and 5K RPS peaks. Works in React and Next.js on the frontend and has led a team of five.

SKILLS

Backend	Go (Golang), Gin, pgx, sqlc, Node.js, NestJS, Hono, Express, REST APIs, gRPC, protobuf, Better Auth
Messaging and reliability	RabbitMQ, Amazon SQS, Amazon EventBridge, transactional outbox, idempotency keys, webhook intake, retries with jittered backoff, circuit breakers, dead letter queues, event-driven architecture, microservices
Frontend	TypeScript, JavaScript, React, Next.js, Redux, TanStack Query, Vite, Refine, Tailwind CSS, shadcn/ui
Cloud	AWS (EC2, ALB, Lambda, S3, SQS, EventBridge, RDS, Aurora Serverless v2, CloudFront, ACM, Secrets Manager), SST, Azure (App Service, Virtual Machines)
Data	PostgreSQL, Redis, MySQL, MongoDB, Elasticsearch, Prisma, TypeORM
Ops and delivery	OpenTelemetry, slog, Sentry, alerting, Amplitude, testcontainers-go, contract tests, Docker, Nginx, CI/CD, Turborepo, Linux
Also	Python, C#, PHP, C++
Languages	English (C1), Armenian (native), Russian (C1), Spanish (B1)

PROJECT EXPERIENCE

Interexy · Senior Full-Stack Engineer

Feb 2025 - Present

Rowte.io (FinTech, B2B) · Lead Full-Stack Engineer

Multi-currency commission payouts for education agencies, with enrollment matching and document checks. Led a team of three and owned the Go backend and every code path that touches money.

KEY ACHIEVEMENTS

- Shipped the MVP in three months from no code, with no critical financial discrepancies at launch and a duplicate-payment guard on every payout-state transition.
- Replaced a 2-3 day spreadsheet reconciliation with a job that matches 40,000 enrollments against 38,000 payments in 45 seconds.
- Handed the platform over at the end of the engagement with runbooks and a documented event catalog.

RESPONSIBILITIES

- Built the payout engine in Go: integer minor units, one transaction per state change, double-entry postings reversed by a contra entry.
- Implemented idempotency as Gin middleware. A replayed key returns the original response, a concurrent duplicate gets 409, and a reused key with a new payload is rejected.
- Added a transactional outbox from Postgres to RabbitMQ, and moved commission runs, payout notifications and document callbacks onto Go workers and Lambda handlers.
- Wrote a rerunnable reconciliation job that sorts each break by cause for operations.
- Set up AWS (CloudFront and ACM at the edge, an ALB over three EC2 targets with Nginx, Secrets Manager) and OpenTelemetry tracing with alerts on payout-state age and outbox lag.
- Designed service boundaries, PostgreSQL schemas and CI/CD, RBAC and MFA for agencies, sub-agents, institutions and staff, and a Refine admin for partners and reconciliation.

Stack Go, Gin, pgx, sqlc, PostgreSQL, RabbitMQ, Redis, AWS (EC2, ALB, Lambda, S3, RDS, CloudFront, ACM, Secrets Manager), Nginx, Docker, OpenTelemetry, testcontainers-go, TypeScript, Next.js, Refine, Better Auth, Turborepo

Supplier Success Accelerator (B2B SaaS, GovTech) · Full-Stack Engineer

A platform where government agencies coach small suppliers. Owned the integration architecture for a seven-person team: support, scheduling, email, analytics and learning tools in one event flow.

KEY ACHIEVEMENTS

- Delivered five external integrations with no integration-related production incidents over 11 months.
- No lost inbound events at 10,000 supplier actions a day, confirmed by a daily reconciliation against provider records.
- Median first support response fell from 4h10m to 1h15m, and feature adoption rose 25%.

RESPONSIBILITIES

- Built webhook intake as a Hono route group: signature checks in middleware, an idempotency table keyed on the provider's event id, raw payload stored before processing.

- Wrote per-provider retries with jittered backoff, a circuit breaker and a replayable dead letter path. Intake goes through SQS, and an outage delays processing without losing events.
- Kept the compute-heavy work in Go services behind Gin, called from the Hono API: scoring and aggregation runs over supplier assessment data.
- Integrated Zendesk (chat, identity bridging, automation), Calendly (webhooks plus a reconciling polling sweep), Mailchimp (45% campaign engagement) and Amplitude.
- Ran the backend on AWS with SST, and added contract tests on provider payloads in CI that caught two breaking provider changes before release.
- Built the Next.js and TypeScript frontend with TanStack Query.

Stack TypeScript, Hono, oRPC, Prisma, Go, Gin, PostgreSQL, Redis, AWS (Lambda, S3, SQS, EventBridge, Aurora Serverless v2), SST, OpenTelemetry, testcontainers-go, Next.js, TanStack Query, Tailwind CSS, shadcn/ui

NextStreet (FinTech, small business lending) · Full-Stack Engineer

KEY ACHIEVEMENTS

- Cut core reporting query times by 60% after refactoring the PostgreSQL schemas.
- Shipped 15 features across three teams: admin load time down 40%, application submissions up 25%.

RESPONSIBILITIES

- Split the backend between NestJS for I/O-heavy APIs and integrations and Go services for concurrent data processing, calculations and analytics pipelines.
- Integrated the CRFUSA partner platform with automated data exchange to cut manual onboarding.
- Rebuilt the internal admin panel in React, Redux and TypeScript, and moved 15 legacy components to stricter TypeScript.

Stack Go, NestJS, TypeScript, React, Redux, PostgreSQL, AWS, Docker, REST API

EARLIER EXPERIENCE

OkVPN (consumer SaaS) · Senior Full-Stack Engineer (contract)

Mar 2024 - Feb 2025 · VPN subscriptions, billing and referral payouts

- Led the migration from a NestJS monolith to Go microservices over gRPC and RabbitMQ, keeping NestJS as a thin API layer for the dashboard.
- Designed Go services for subscriptions, user access and background processing, plus a referral payout service on RabbitMQ events that grew subscriptions 12% in 3 months.
- Set up Sentry, structured logging and alerting (time to detect critical issues down 60%) and reworked the AWS deployment pipelines (downtime down 70%).
- Added Redis caching (response times down 50%) and built the billing dashboard in React and Redux, cutting billing support requests by 40%.

Stack Go, gRPC, protobuf, RabbitMQ, PostgreSQL, Redis, TypeScript, NestJS, React, Redux, AWS (EC2, RDS, S3), Sentry, Docker

RedNeck Studio · Full-Stack Engineer (contract)

Aug 2024 - Jan 2025 · Telegram mini app games, 3M users

- Supported 10 fault-tolerant mini apps at peaks of 5K RPS, built gRPC streaming uploads of multi-GB files into S3, integrated 10 ad platforms (C#, NestJS, React) and built Refine admin panels.
- Led a frontend team of 5 on the DONT project and delivered its React and Vite UI.

Stack TypeScript, NestJS, C#, gRPC, PostgreSQL, AWS (EC2, S3), React, Vite, Refine

Kodix · Backend Engineer (contract)

May 2024 - Aug 2024 · configuration CMS for a premium automotive brand

- Designed the CMS on NestJS, TypeORM and PostgreSQL, ending manual editing of 5,000-line JSON configs, and integrated third-party services including email distribution.

Stack TypeScript, NestJS, TypeORM, PostgreSQL, AWS (EC2, S3)

CROSSNETICS · Full-Stack Engineer

Dec 2022 - May 2024 · marketing platform with AI and web3 features

- Built fault-tolerant REST APIs on AWS serving 1M requests a day under 200 ms.
- Split the platform into microservices, writing the new high-load services in Go, and set up Swagger docs with typed contracts shared by backend and frontend.

Stack TypeScript, NestJS, Go, Next.js, MySQL, Redis, Elasticsearch, AWS (EC2, RDS), Swagger

FaceStellar · Full-Stack Engineer (contract)

Sep 2022 - Dec 2022 · CRM system

- Built the CRM on Node.js, Express and React with CI/CD to Azure App Service.

Highway Logistic Group · Backend Engineer

Feb 2022 - Sep 2022 · logistics CRM

- Migrated the CRM from PHP 5 to 7.4 (40% faster) and ran its MySQL databases on Azure VMs.

EDUCATION

London School of Economics and Political Science (University of London) · BSc Data Science · 2019 - 2023
